# DNS Forwards for Azure ADDS & SSO via O365 identity

## Overview

Users can't access company websites on primary email domain.

For Example, NetApp employees in VDS workspaces can't access [netapp.com](https://netapp.com) if their SSO account is [user@netapp.com](mailto:user@netapp.com)

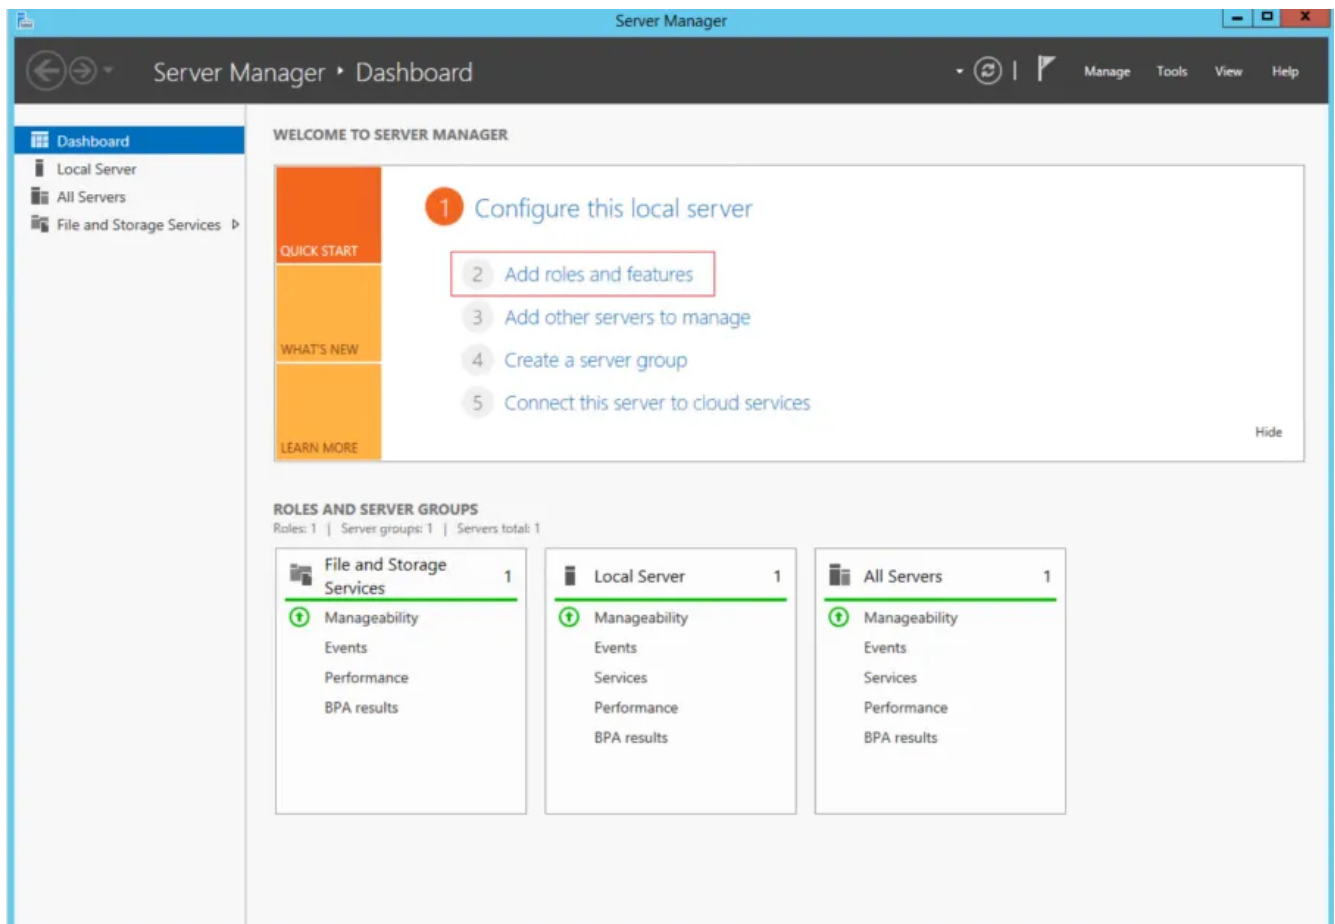

Dedicated VDS deployments use the internal domain of the Azure tenant.

## Resolution

To resolve this, the Organization's team that manages DNS will need to create a DNS forward lookup zone for your internal domain to allow it to resolve the the correct external IP (for NetApp's purpose, this would let NetApp employees browse to [netapp.com](https://netapp.com) from within their virtual desktop).

## Step by Step Guide

1. Install the DNS Server Tools on CWMGR1 – this will allow you to manage DNS.

This wizard helps you install roles, role services, or features. You determine which roles, role services, or features to install based on the computing needs of your organization, such as sharing documents, or hosting a website.

To remove roles, role services, or features:  
[Start the Remove Roles and Features Wizard](#)

Before you continue, verify that the following tasks have been completed:

- The Administrator account has a strong password
- Network settings, such as static IP addresses, are configured
- The most current security updates from Windows Update are installed

If you must verify that any of the preceding prerequisites have been completed, close the wizard, complete the steps, and then run the wizard again.

Select the installation type. You can install roles and features on a running physical computer or virtual machine, or on an offline virtual hard disk (VHD).

☒ **Role-based or feature-based installation**

Configure a single server by adding roles, role services, and features.

☐ **Remote Desktop Services installation**

Install required role services for Virtual Desktop Infrastructure (VDI) to create a virtual machine-based or session-based desktop deployment.

2. Once installed, you can go to Control Panel → System and Security → Administrative Tools and open up DNS.

The screenshot shows a Windows File Explorer window with the address bar set to **Control Panel > System and Security > Administrative Tools**. The left sidebar shows the 'Quick access' pane with 'This PC' selected. The main pane displays a list of administrative tools. The 'DNS' item is highlighted in blue.

3. When asked for the DNS server running DNS you will want to put in your domain name (in the example we've been using, this would be *netapp.com*).
